BUREAU OF CEYLON STANDARDS

53, Dharmapala Mawatha,

Colombo 3,

Sri Lanka.

Sri Lanka Standards are subject to periodical revision in order to accommodate the progress made by industry. Suggestions for improvement will be recorded and brought to the notice of the Committees to which the revisions are entrusted.

This Standard does not purport to include all the necessary provisions of a contract.

SLS 428 : 1977

SRI LANKA STANDARD ON RANDOM SAMPLING METHODS

FOREWORD

This Sri Lanka Standard was authorized for adoption and publication by the Council of the Bureau of Ceylon Standards on 1977-06-22. This is an adoption of JIS Z 9031:1956 and its adoption as a Sri Lanka Standard was recommended by the Drafting Committee on Statistics and Quality Control of the Bureau.

With greater recognition of the importance of statistical techniques in quality control work, it has become necessary to introduce more and more statistical techniques in quality control work and also to facilitate the application of the techniques which are already in use.

Sampling is of fundamental importance for estimating the quality of a lot for ascertaining its conformity to the requirements of a specification. The economy, reliability and practicability of the sampling procedures have made them almost indispensable in most of the industrial and trade applications. However, the reliability of the conclusions drawn on the basis of the sample depends on its representativeness and the method of its selection. Since this vital aspect of sampling has not received wide attention, it was felt desirable to lay down the basic procedures for the selection of a random sample under diverse situations. It is hoped that the sampling methods laid down in this standard, when implemented, would ensure a truly random and representative sample leading to sound and satisfactory estimation of quality.

This is one of a series of standards on statistics and quality control prepared by the Drafting Committee on Statistics and Quality Control. The other in the series being,

SLS 421 Statistical vocabulary and symbols

SLS 427 Sampling procedures and tables for inspection by attributes

1 SCOPE

This standard covers the methods of conducting random sampling.

2 HOW TO MAKE A SEQUENCE OF RANDOM NUMBERS

2.1 Method of using a table of random numbers

The following method shall be used to make a sequence of random numbers using the accompanying table of random numbers (see Note).

NOTE - A table of random numbers is a random sequence of numbers from 0 to 9. Any other table besides the one shown here, if made in a logical manner and statistically tested, may be used instead. The following procedure may be applied in such a case also.

2.1.1 Determine the starting point at random

Take a pencil and drop it with the eyes closed on any page of the table, and the 3 successive numbers read off from the number nearest to the point hit shall be the row number (000 in this case shall be regarded as 1000). The column number shall be determined by dropping the pencil again and taking the nearest number to the point hit (Since 10 sets of 4 numbers each are included in a row, these sets are numbered 1 to 9 and 0 from the left, and the left-end number of the set chosen shall be the starting point).

EXAMPLE :

A page was opened which turned out to be Table 2, but when a pencil was dropped with the eyes closed it dropped between two numbers, so a trial was made again. This time the pencil dropped closest to 0 and the 3 successive numbers were 047, so the 47th row is chosen. The pencil was dropped again and hit 9, so the 9th column is chosen. In other words, the left end of 73, 53, which is on the 47th row and 9th column of Table 2 becomes the starting point.

2.1.2 Read off the original sequence of random numbers

When either 1 or 2 digit numbers are necessary, the numbers are read off from left to right, moving on to the left end of the next row when the right end is reached.

When 3 or more digit numbers are necessary, the numbers are read off from top to bottom, moving on to the next column of the same page when the bottom end is reached. The last of the 4 numbers in a set is neglected when only 3 digits are necessary.

Move on to the top-left corner of the next page when the bottom-right corner is reached. Return to the first page when the last page is reached.

EXAMPLES:

- 2 In the case an original sequence of random numbers with 3 digits is needed, if we also start from the left end of Row 47 Column 9, we obtain 735, 468, 723, 562, (and moving on to the next column) 696, 840,
- 2.1.3 Transform the sequence into that of a given range

When the necessary range of the random numbers is 1 to N, one of the following transformations is made according to the value of N.

a) When N < 10

Take an original sequence of random numbers with 1 digit, and read the numbers off neglecting those exceeding N, 0 is regarded as 10.

b) When 11 ≤ N ≤ 20

Take an original sequence of random numbers with 2 digits, substitute each number with the remainder obtained in dividing by 20, and read them off neglecting those exceeding N, 0 is regarded as 20.

c) When 21 ≤ N ≤ 50

Take an original sequence of random numbers with 2 digits, substitute each number with the remainder obtained in dividing by 50, and read them off neglecting those exceeding N, 0 is regarded as 50.

d) When 51 ≤ N ≤ 100

Take an original sequence of random numbers with 2 digits, and read them off neglecting those exceeding N, 00 is regarded as 100.

e) When N exceeds 100

A similar procedure as above is followed.

For example: if $101 \le N \le 200$, an original sequence of random numbers with 3 digits is taken and each number is substituted with the remainder obtained in dividing by 200, and if $201 \le N \le 500$, each number is substituted with the remainder obtained in dividing by 500, while if $501 \le N \le 1000$ the numbers are unchanged, thus obtaining transformations similar to b), c) and d) respectively.

NOTE - When each random number is needed only one, only those appearing first are retained.

EXAMPLES:

1 In order to make a sequence of random numbers of the range 1 to 30, take, for example, the following original sequence of random numbers with 2 digits obtained in Example 1 of 2.1.2

73, 53, 35, 90, 38, 51, 64, 06, 53, 30, 50, 06, ...,

substitute each number with the remainder obtained in dividing by 50.

23, 3, 35, 40, 38, 1, 14, 6, 3, 30, 0, 6, ...,

and neglecting those above 30, we read off

The sequence of random numbers 23, 3, 1, 14, 6, 3, 30, 6, ... is thus obtained. If we eliminate the random numbers appearing more than once, it becomes 23, 3, 1, 14, 6, 30,

2 In order to make a sequence of random numbers of the range 1 to 155, take, for example, the following original sequence of random numbers with 3 digits obtained in Example 2 of 2.1.2

735, 468, 723, 562, 696, 840, ...,

substitute each number with the reminder obtained in dividing by 200,

135, 68, 123, 162, 96, 40, ...,

and neglecting those exceeding 155, we read off

135, 68, 123, ..., 96, 40, ...,

we thus obtain the sequence of random numbers 135, 68, 123, 96, 40, ...

2.2 Methods other than the use of a table of random numbers

Other methods of making an original sequence of random numbers besides the use of a table of random numbers include the use of random numbers generated by such random mechanisms as dice, a rotary wheel with a numbered dial, lottery type chips, and so forth. The procedure explained in 2.1.3 may be followed without change in this case also.

3 RANDOM SAMPLING

3.1 Simple random sampling

In order to rake a sample of size n from a lot of size N at random, either of the following two methods is used according to circumstances.

3.1.1 Method 1

This method may be used in all cases.

a) Number the N articles from 1 to N.

NOTE - These numbers need not be actually stamped on the articles so long as they are made apparent. For instance, the N articles may be arranged in a row so as to make it easy to tell the order of the articles.

- b) Make a sequence of random numbers of the range 1 to N according to 2.1, and choose the first n random numbers eliminating any repetition of numbers.
- c) Sample the articles corresponding to the numbers chosen.

EXAMPLE:

In order to sample 6 articles from among 30 articles, make a sequence of random numbers of the range 1 to 30 according to 2.1.3 and choose the first 6 random numbers after eliminating any repetition.

If the sequence happens to be 23, 3, 1, 14, 6, 30 as in Example 1 of 2.1.3, the 23rd, 3rd, 1st, 14th, 6th and the 30th article are sampled.

NOTE - This method may also be applied to such cases as nails in a barrel, or a shipment of ore, by determining a suitable sampling unit and utilizing the fact that they may be rearranged in a row by transferring.

3.1.2 Method 2

This method may be used when N articles are placed in a container such as a box in a definite arrangement, and the operation of sampling n articles is repeatedly carried out.

- a) Sampling cards are made beforehand. That is, a number of cards are prepared which have lines and numbers written down on them resembling the arrangement of the articles within the box, and circles are marked on the cards according to either of the following methods:
- 1) When the number of combinations

$${}_{N}^{C}{}_{n} = \frac{N(N-1) \dots (N-n+1)}{1.2 \dots n}$$

is small, circles are marked on ${}^{C}_{N}$ cards so as to represent every combination.

2) When the number of combinations ${}_{N}^{C}$ is large, a sequence of random numbers of the range 1 to N is made according to 2.1, the first n random numbers eliminating any repetitions are chosen, and circles are drawn on the card around these numbers. This is repeated so as to make 100 or more cards.

EXAMPLES:

i) When n=2 articles are to be drawn from N=20 articles arranged as in Fig. 1

$$c_2 = \frac{20 \times 19}{1 \times 2} = 190$$

so 190 cards like those in Fig. 2 are prepared, and letting each card correspond to the combinations

a circle is drawn around each corresponding number as in Fig. 3.

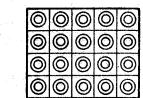

FIGURE 1

$\sqrt{7}$				5
	7			10

FIGURE 3

ii) When n=3 articles are to be taken from N=20 articles arranged as in Fig. 1, the number of combinations

$$20^{\circ}$$
 = $\frac{20 \times 19 \times 18}{1 \times 2 \times 3}$ = 1140

is too large so that method 2) should be employed.

100 or more such cards as in Fig. 2 are prepared, a sequence of random numbers of the range 1 to 20 made eliminating any repetitions, and the first 3 random numbers are chosen. This is repeated to make cards such as in Fig. 4.

7	2	3	4	5	1	1	2	3	(4)	5	1	2	3	4	5	
6	7	8	9	(10)		6	7	8	9	10	16	7	8	9	0

16	17	18	19	20	П	16	17	(18)	19	20	14	17	18	19	20	

FIGURE 4

- b) One card is picked at random from among such cards.
- c) Articles corresponding to the circled numbers of the card drawn are sampled.

NOTE - This method may be applied to such cases as when a portion of steel sheets or paper of definite size is to be sampled.

3.2 Systematic sampling

The following procedure is employed in order to sample n articles with equal intervals from among N articles arranged in a row.

- a) Number the articles from 1 to N.
- b) The integer portion k of the value obtained by dividing N by n is taken as the sampling interval.
- c) A number between 1 to k is chosen at random.
- d) Starting from the article corresponding to the chosen number every k article is sampled. Then the total number of articles sampled will become either n or n+1. When it becomes n+1 and it is definitely necessary that the number of articles should be n, 1 article is excluded at random.

EXAMPLE:

In order to sample 10 articles from among 128 systematically, $\frac{128}{10}$ = 12.8,

so the sampling interval k = 12. If 6 was the number chosen at random among 1 to 12, articles corresponding to

are sampled.

In this case 11 articles will be sampled. If it is definitely necessary that only 10 are sampled, a new number is chosen at random from among 1 to 11, and if this happens to be 2, the 18th article is withdrawn from the sample.

NOTES :

- 1 This method may also be applied to such cases as nails in a barrel, or a shipment of ore, by determining a suitable sampling unit and utilizing the fact that they may be rearranged in a row by transferring.
- 2 Systematic sampling is not recommended when a periodic variation is expected.

REFERENCE :

The methods explained in 3.1 or 3.2 may be applied to random sampling included as an element of two-stage, multistage or stratified sampling.

4 RANDOM ARRANGEMENT

Either of the following three methods shall be employed to rearrange the order of N articles at random.

4.1 Method 1

- a) Number the N articles from 1 to N.
- b) A sequence of random numbers with a large enough number of digits (see Note) is made and the first N numbers eliminating any repetition are chosen.

NOTE - 2 digits for
$$N \le 20$$

3 digits for $21 \le N \le 100$
4 digits for $101 \le N \le 1000$
......will be sufficient.

c) Number the random numbers chosen in (b) according to the order of magnitude and arrange the articles in the order of the numbers.

EXAMPLE:

If N = 12 articles are to be arranged at random, first number the articles from 1 to 12, then pick put from among an original sequence of 2-digit random numbers.

73, 53, 35, 90, 38, 51, 64, 06, 30, 50, (06), 84, 55,

12 different numbers (up to 55). If these are numbered according to the order of magnitude, they become

10, 7, 3, 12, 4, 6, 9, 1, 2, 5, ---, 11, 8 so the articles are arranged in this order.

4.2 Method 2

- a) Sample 1 article at random from among N articles and place it first.
- b) Sample 1 article at random from the remaining N to 1 articles and place it second.
- c) Repeat this process until there is no remainder.

4.3 Method 3

- a) Number the N articles from 1 to N.
- b) Make a sequence of random numbers of the range 1 to N eliminating any repetition according to 2.1 until every number from 1 to N turns up.
- c) Arrange the articles according to the order of the numbers obtained in b).

NOTE - The methods explained in 4 may be applied to such cases as the randomization process in the design of experiments.

Table of random numbers (1 to 40)

This table includes a total of 40000 numbers arranged in the following manner:

Number of pages 40 Number of numerals per page 1000 Total number of rows 40 Number of numerals per row 40

The row numbers, numbered continuously from 1 to 1000, are shown on the left-hand margin. 25 rows are included in a page.

10 sets of 4 numbers each constitute a row, so 25 rows and 10 columns constitute a page (each column is numbered 1, 2, ..., 10 from the left).

The grouping within the rows are for the ease of rading the numbers off and has no real meaning.

SLS CERTIFICATION MARK

The Sri Lanka Standards Institution is the owner of the registered certification mark shown below. Beneath the mark, the number of the Sri Lanka Standard relevant to the product is indicated. This mark may be used only by those who have obtained permits under the SLS certification marks scheme. The presence of this mark on or in relation to a product conveys the assurance that they have been produced to comply with the requirements of the relevant Sri Lanka Standard under a well designed system of quality control inspection and testing operated by the manufacturer and supervised by the SLSI which includes surveillance inspection of the factory, testing of both factory and market samples.

Further particulars of the terms and conditions of the permit may be obtained from the Sri Lanka Standards Institution, 17, Victoria Place, Elvitigala Mawatha, Colombo 08.

SRI LANKA STANDARDS INSTITUTION

The Sri Lanka Standards Institution (SLSI) is the National Standards Organization of Sri Lanka established under the Sri Lanka Standards Institution Act No. 6 of 1984 which repealed and replaced the Bureau of Ceylon Standards Act No. 38 of 1964. The Institution functions under the Ministry of Science & Technology.

The principal objects of the Institution as set out in the Act are to prepare standards and promote their adoption, to provide facilities for examination and testing of products, to operate a Certification Marks Scheme, to certify the quality of products meant for local consumption or exports and to promote standardization and quality control by educational, consultancy and research activity.

The Institution is financed by Government grants, and by the income from the sale of its publications and other services offered for Industry and Business Sector. Financial and administrative control is vested in a Council appointed in accordance with the provisions of the Act.

The development and formulation of National Standards is carried out by Technical Experts and representatives of other interest groups, assisted by the permanent officers of the Institution. These Technical Committees are appointed under the purview of the Sectoral Committees which in turn are appointed by the Council. The Sectoral Committees give the final Technical approval for the Draft National Standards prior to the approval by the Council of the SLSI.

All members of the Technical and Sectoral Committees render their services in an honorary capacity. In this process the Institution endeavours to ensure adequate representation of all view points.

In the International field the Institution represents Sri Lanka in the International Organization for Standardization (ISO), and participates in such fields of standardization as are of special interest to Sri Lanka.
